

Description

For the passage of larger squads, for example a person with a bicycle, ABAS bicycle lock can advantageously be used. The passage system consists of a fenced cage with palisades on the long side and two Plexiglas mounted sliding doors on the cross side.

Upon entry, the first sliding door opens at approved identification, and the person can enter the cage. This closes the door fully before the opposite door can be opened.

The lock can be combined with a traditional rotational gate or a regular walking gate.
